

# Marine life cards

**Sperm whale**

The sperm whale is the largest toothed whale on the planet, living in ice-free oceans around the world. They often hunt at depth and eat larger prey such as squid.

**Mussel**

Mussels are a type of shellfish. They live in coastal waters, mostly in temperate oceans. They feed by filtering the seawater for plankton, small sea creatures floating in the water.

**Lanternfish**

Lanternfish live in all the world's oceans. They live at depths of between 300m and 1,500m, rising towards the surface to feed at night. They feed on plankton, small animals drifting on the ocean currents.

**Albatross**

Albatross live across the southern oceans of the world and in the North Pacific. They return to land to breed and nest. They eat a range of marine life including squid and fish.

**Green turtle**

Green turtles live across tropical and subtropical oceans worldwide. They nest on beaches and can be found near human settlements. Turtles eat many different foods including jellyfish.
